Cantillo (NOAA) in 2001 as part of the Coastal and Estuarine Data/Document Archeology and Rescue (CEDAR) for South Florida. sponsored by the South Florida Ecosystem Restoration Prediction and Modeling Program. Original stored at the Library, Rosenstiel School of Marine and Atmospheric Science, University of Miami. Minor editorial changes were made.]

SUMMARY OF FLORIDA COMMERCIAL MARINE LANDINGS FOR 1952

This is the third year in which the Summary of Florida Commercial Marine Fish Landings has been compiled by the Marine Laboratory of the University of Miami and the U.S. Fish and Wildlife Service. During these years, commercial fishery statistics have been collected on a monthly basis as compared to the former method of gathering the data at the close of the calendar year.

The monthly report system was set up in September of 1950 as a cooperative undertaking between the U.S. Fish and Wildlife Service and the Marine Laboratory of the University of Miami on behalf of the Florida State Board of Conservation. Each agency employs one man for the purpose of collecting and compiling, the fishery statistics. The system requires wholesale fish dealers to report their monthly fish production to the Marine Laboratory in Coral Gables. Forms and return envelopes are sent to the dealers at the close of each month for their convenience in reporting. The data are compiled each month and printed in the Florida Landings. An accumulative total is carried through the year for tabulation in the yearly summary.

Compilation of Florida fisheries data is complicated by several factors. Throughout the state there are 400 to 420 wholesale fish dealers distributed over 1200 miles of coastline and reporting from 33 counties. There are over 70 commercial species caught, the landings of which totaled over 256 million pounds in 1952. This represents more coastline, more dealers, and more species than any other state in the nation. Florida's catch ranks about fourth to sixth in both production and value in the United States.

Since some dealers neglect to report their landings in same months, trips must be made to collect the reports personally. For one man to cover the state, it takes over 2500 driving miles and consumes about ten days.

Unfortunately, the very nature of the present system leads to some concern as to the validity of the production records, since principally it is dependent upon the industry's willingness to cooperate. Time and funds do not permit a scrutiny of each dealer's records so that in the final analysis the summary of reported catches is accurate only so far as the integrity of the dealers has allowed.

It has been attempted wherever possible to allocate the catch to counties in which it was landed. In some cases, however, landings were reported in the resident county of the dealers but the fish produced in another county.

In addition to marine landings some landings of fresh water catfish have been summarized. This is only a small portion of the state's commercial catch of fresh water species. Fresh water catfish production was reported by dealers who handle both marine and fresh water species. Statistical summaries of fresh water commercial fisheries may be obtained from the Florida Game and Fresh Water Fish Commission in Tallahassee.

From the standpoint of the fishing industry, fishery research, and those interested in economic statistics of Florida, it would be desirable to have marine and fresh water statistics combined. However, after a serious attempt to incorporate the programs, it was decided that because of different methods of collection and compilation employed by the two agencies, combination of the data was not possible at this time.

While it is felt that most of the production figures shown for the larger fisheries are fairly representative of the actual catch, it is known that some of the others are not as accurate as desired. For example, most of the wholesale oyster dealers report their shucked oyster production accurately; whereas the production and sale of bagged oysters for the half-shell

trade may be done in such a manner that reliable records are not properly kept. Practices such as this result in deficient reports at the close of the month. This and many other difficulties are being overcome gradually by exerting effort on each potential discrepancy as it occurs.

On pages [BLANK] and [BLANK] the production has been broken down to East and West Coasts with values assigned to each coast. The purpose of this section is to indicate the primary value for the fishery products to the fishermen. This information was gathered throughout the year on a monthly basis by personal interviews with dealers. Prices paid to fishermen each month were tabulated at the end of the year on a weighted sample principle.

For future evaluation of Florida fisheries, space has been set aside on the monthly production forms in which the dealers may indicate current prices paid to fishermen for each species. Since this section is to be strictly voluntary on the part of the dealers, it is hoped they will realize the need for this additional information and will comply by supplying the desired data.
